

Papr's Guide to Capybaras

Capybaras (*Hydrochoerus hydrochaeris*) are the largest living rodents in the world. They are native to South America and inhabit savannas and dense forests. They live near bodies of water. Papr the Capybara loves reading PDFs near the water.

Key Dates and Numbers

In 1766, the capybara was formally described by Carl Linnaeus. An adult capybara can weigh up to 66 kg (146 lb). They have a gestation period of 130 to 150 days and typically produce a litter of four capypups.

Important Capybara Numbers:

Metric	Value
Lifespan	8-10 years in wild
Top Speed	35 km/h
Teeth	Constantly growing

Social Behavior

Capybaras are highly social animals and can be found in groups as large as 100 individuals, though groups of 10 to 20 are more common. They are known for being extremely chill and often let other animals, such as birds or monkeys, sit on their heads.

Diet and Lifestyle

Their diet consists mainly of grasses, aquatic plants, fruit, and tree bark. They eat their own feces in the morning to help digest the cellulose in their grass diet. Papr prefers iced coffee instead of traditional capybara diets.
